DENTAL IMPLANTS

WHAT ARE DENTAL IMPLANTS & HOW CAN THEY HELP YOU?

The most common indication is when missing a single tooth. The implant functions like the root of the tooth which supports a crown.

IMPLANTS CAN ALSO BE USED IN PAIRS OR GROUPS TO SUPPORT IMPLANT BRIDGES

This means we can replace large numbers of teeth with fewer implants.

If there are enough implants, a denture can be made to snap in and out, or a full set of teeth can be screwed into place so the teeth are permanently fixed on the implants.

$ HOW MUCH DO IMPLANTS COST?

Implants typically range from $1500-$2500 and the restoration attached to it ranges due to size and complexity of case.

DO IMPLANTS HURT?

People are often shocked at how easy implant placement can be. It's typically even easier than removing the tooth it replaces.

HOW LONG DO IMPLANTS LAST?

Like natural teeth, implants rely on good oral health care in order to last a long time. When cared for, implants are designed to last decades—possibly even a lifetime.

FUN FACT

Dr. Branemark introduced implants to dentistry in 1982

I NEED AN IMPLANT; WHAT’S THE PROCESS?

Tooth needs extraction

Tooth is removed, bone graft placed (last bone heals 3-6 months)

Place implant (first implant heal 9-12 months)

Temporary tooth placed to improve bite 

Final, custom-made abutment & crown attached to implant
